

Milestone 1 reflection

To begin my milestone 1 project i was asked to create a website on a historical landmark in Manchester, doing so i chose to have my website based on the radcliffe tower. The decision I made to focus on Radcliffe tower was to reflect my appreciation for the local history of Manchester and its cultural significance. I decided to structure my website with a home page, gallery page, about page, and info page to ensure an engaging and user-friendly experience. The home page that I created provides a useful but simple page as to what my website is about and outlines the purpose of the site ,while the gallery page shows a visual display of images to help users connect with the architectural significance of the tower itself. My about page offers detailed historical context, enhancing my users' understanding of this historical landmark with information such as cultural significance, architectural details, restoration efforts, local legends and stories, the surrounding area and finally educational opportunities. The about page that i created is a simple page that gives the user the refined valuable information in which they may need to find out more about the tower or the location in where to visit it. In my website I have created a navigation bar with working links to each page and also a footer at the bottom with standard contact information. The colours in which i used represented a warm and welcoming page which.

Milestone 2 reflection

To start my milestone 2 I planned it all out in my notebook. I started by noting down the basics in which I need to do to create my website as shown in this image. I found it useful to note down the things I needed to do to create my website as it helps me plan everything in my website step by step efficiently to ensure I make as little errors as possible to maximise my productivity in this project. After noting down all the information I needed for each page I began to sketch out each different page I was creating including my home page, gallery page and information page as shown below this also helped with productivity.

After planning out all of my pages i began to start with my website by using my plan that i created in order i started to code the basics of my navigation bar in which i decided to add a simple but effective title along with a prominent blue colour that i picked to go with Tottenham's colour scheme as shown below.

After this I then began to work on my footer, to create my footer this time I used Manchester City's light blue colour scheme to contrast to Tottenham's at the top of the page. In my footer I added basic contact info and I also added links at the bottom to each club's merchandise page and both of their instagrams as you can see below.

About

This is a dedicated website made for the Tottenham Hotspur vs Manchester City game on the 23rd of november 2024

To get the exact colours of both Tottenham's badge and Manchester city's badge i used the website <https://imagecolorpicker.com/> to pick out the exact colours of both teams club badges to import the hexadecimal colour code into my css for my website so that it would be clear to anyone seeing my page that the website is based on tottenham vs manchester city. To create my Home page, Gallery page and info page i used basic coding and flex box to create my website. I followed my plan step by step to help me plan out everything i needed to do in order of what was to come.

Milestone 2 A

To start with the milestone 2a task i was asked to implement some things in which i was not familiar with. Implementing the dropdown menu in this task was shown to be very challenging in the way in which when you hover over it the menus box needs to be perfect in its positioning. There were many challenges that i had faced coming across this project as the dropdown menu caused more or less all of them, implementing the text height and which line height had to be what size was something i found quite difficult and frustrating as i had to use lots of trial and error on this to ensure that the project would look its best. I created this website with very simple html and css not looking for the best aesthetic however just wanting to add in that form of interactivity in this task to show myself new skills and features. With this I did not put all of my effort into the design of the overall website but only the dropdown menu, mail footer and the columns. To expand on this website I added another interactive element where the user can click on a link and it will take you to email straight away with the user's email already typed out. I achieved this with the `"mailto:"` link. The last thing that I focused on in my project was the columns of writing in the center, to achieve this I used flexbox to create 2 columns inside a main container. This expands my knowledge of simple flexbox and overall interactivity with users in websites using html and css.

Milestone 2 B

For this project, i aimed to recreate the BBC homepage using HTML and CSS. This task involved analyzing the structure and also the design of the whole of BBCs website breaking the website down into smaller more manageable components then rebuilding it step by step until i got something that looked similar th their website. I started off by copying their logos that they use and the top of their website like these   and adding them in their own header at the top of the website to look like they were clickable links next to the BBCs main

image logo **BBC** my next step was to start to lay out the page with many different boxes scattered all over the websites home page. I decided to add 11 boxes in a

format like the BBCs using 11 `</div>` functions to create each box then styling them in css. Each box had 24px of padding around them to ensure that none of them would be touching, the boxes as well all each had their own black border of 5px around each box . the most challenging part of this task was to position each box to make sure that they were not touching. Having 11 different boxes to position can pose as quite a problem however with some help and dedication the re creation of the BBCs website was complete.

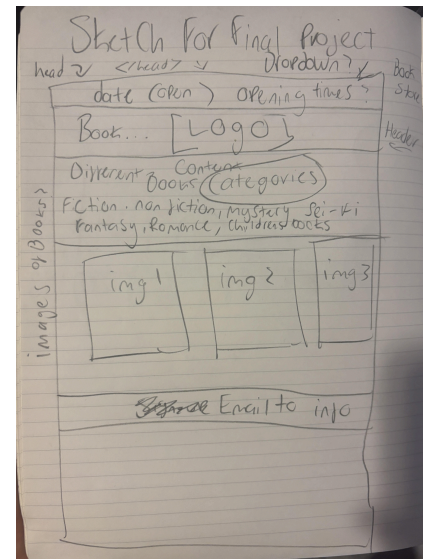

Final project web tech

Before i decided to dive straight into my final project and the overall development of my website i began by planning everything on paper. This allowed me to organize my thoughts and ensure that i had a clear and thought out direction for my project. I started by sketching out the overall layout in which i wanted my project to look like. I needed this to be an interactive project so spent lots of time figuring out where i can add interactivity as much as possible. I decided that i needed to have the website compatible with tablets, mobile phones and large computer screens. First in my plan i needed to decide what my website was going to be about so i made it about a book store named The book Nook. i decided on having the opening times for my book shop at the top of my website as you can see in my very roughly sketched plan however later on in the creation of this i had the idea to make this opening times into a dropdown menu. With this i decided on making a dropdown menu at the top of my navigation bar next to my Home page, Gallery Page and my Shop to ensure that it is well seen as you can see in my image on the right i used a specialised font

using the `font-family: 'Courier New', monospace;` function to create a more homely environment for my users that see my website. My homepage of my book store website consists of a unordered list of every available book that is in the pretend store then underneath that i added 2 books and the new york times logo in a floating image using floats and flexbox while ordering them 1,2 and 3 using flexbox. Along with this i wanted a footer in which had small information but also some interactivity to go along with this so i added a footer with the `"mailto:"` function so that it gave my website some more interactivity.

Moving on to my shop page this is where i wanted the interactive parts of my website to come out, doing this i decided to add 12 books that were available in the shop and display them like items in a shop. To make this interactive i used hover and shadow to make the books look more interesting with rounded edges at each image. Another thing i did with these books to make them more interactive was to add the books title and weather it was available or not when you hover over it as shown in the image presented. For my final page i added an information page which gave information on the pretend book store and some made up contact information which also used the `"mailto:"` function so that when clicked on it sends you to email my school email i designed this with flexbox and css to bring the website together and make it look a lot more professional.
